

Findings & Recommendations for Health Care Improvement

- **Satisfaction and Length of Stay:**

Patients with extended stays report significantly higher satisfaction compared to those with shorter stays, indicating potential concerns with short-term hospitalization experiences.

- **Gender Differences:**

More male patients report slightly higher satisfaction scores, pointing to a potential gender-based disparity in care experiences.

- **Medication Adherence**

Patients who adhere to their prescribed medication schedules report lower satisfaction rating, emphasizing the importance to further investigate medication admission by hospital staffs

- **Follow-Up Appointments**

Patients without scheduled follow-up appointments exhibit higher satisfaction scores, highlighting there's no need for follow-up appointments

- **Age and Follow-Up Adherence**

Middle aged patients are more likely to miss follow-up appointments, suggesting targeted outreach efforts may be beneficial for this demographic.

- **Discharge Destinations**

Patients discharged to nursing facilities or sent home report lower satisfaction compared to those sent to rehab centers, suggesting a review of post-discharge care practices.
